SECTION C -- DESCRIPTIONS AND SPECIFICATIONS

C.1 STATEMENT OF WORK

Statement of Work

I Base Proposal:
The contractor shall conduct research activities to enable for efficient and robust search techniques in complex high dimensional spaces to develop solutions for audio processing applications in high noise environments such as speech activity detection, language identification, speaker identification, keyword spotting, and other audio event detection tasks.
The research shall also include the exploration of advanced analytical methods and system deployment environments for developing integrated solutions including the composition of various analytics and search modules to enable the development of high accuracy and efficient search techniques for ingestion, analysis with various audio mining components from a variety of sources, media, and languages, and triage applications. The plan includes 5 major tasks: 1) Speech activity detection, 2) Language identification, 3) Speaker identification, 4) Keyword spotting system, and 5) TRAP Prototype system.

Task 1: SAO
In this task, the contractor shall explore and develop robust SAD components to be included in the TRAP evaluation system in Task 5.
T1.1 Dynamic Noise Adaptation (DNA)
- Apply DNA approach to the HF Radio Tactical speaker identification database and the NIST 2008 SRE (or equivalent). Compare to baseline system without DNA.
- Extend implemented model to incorporate both linear channel and additive noise effects.
- Propose extension encompassing non-linear effects either by explicit modeling or through the incorporation of Multi-Context Non-Linear Analysis (MCNLA).
- Compare systems with/without MCNLA and DNA on US Government provided data.

Task 2: LID
T2.1 Noise Adaptive Training
- Develop a probabilistic model of the nonlinear channel distortion and the additive noise and an algorithm to jointly estimate the parameters of this model with the acoustic language-specific models.
- Evaluating the performance of this model and the trade off between accuracy and speed for different configurations and approximations.
T2.2 Building a PIUBM System for LID
- Construct a UBM by clustering the ASR acoustic models available for the languages of interest.
- Evaluate the performance of the acoustic supervector SVM-based LID system trained using this UBM.
- Evaluate the performance of the n-gram language model and the SVM-based LID system that model the UBM-based tokenization sequence.
- Compare the performance of integrating the two systems above at the final score level versus using joint decoding.

Task 3, SID
T3.1 Multi-Context Non-Linear Analysis (MCNLA)
- Evaluate the MCNLA system on NIST 2008 interview audio (since stereo recordings of this audio are available for this database). This will represent the system baseline until additional stereo development data is provided.
- Optimize the Me LA setup for rapid experimental evaluation. This will require a software framework that is sufficient for different network linkage configurations.
- Integrate the MCNLA system with the DNA enhanced features and evaluate.
- Train the MCNLA system on the US Government provided database of noisy audio.

T3.2 Adaptive factor Analysis (AFA)
Develop and evaluate a baseline factor analysis system that has a noise subspace explicitly modeled from held out data. Evaluate on TSID and NIST 2008 SRE databases.

Develop an adaptive factor analysis framework that incorporates a noise subspace based on the observed noise variations in the utterance. Evaluate on the TSIDINIST08 combination.

**TASK 4: KWS**

**T4.1** Develop baseline keyword spotting systems for one target language (Arabic)

- Develop speech-to-text models, index, search, and decision functions for KWS.
- Evaluate standard methods for speech enhancement (e.g., spectral subtraction, histogram normalization, and stochastic matching) on the KWS task.

**T4.2** Dynamic Noise Adaptation (DNA)

- Evaluate DNA algorithm on government-supplied audio.
- Begin theoretical work on DNA extensions to nonlinear distortion.

**Task 5: TRAP prototype for evaluation (IBM)**

**T5.1** Develop architecture to enable algorithm developers to contribute components.

**T5.2** Assemble prototype system that incorporates the SAD module, LID, SID, and KWS module to enable the testing of the 4 components.

**Deliverables:**
The TRAP prototype will be delivered for Government evaluation.

**8.2 Option 1 (12 Months)**

In Option I, we shall extend the KWS component to support Farsi.

**Task 4: KWS Option I**

**T4.1** Add capability of baseline keyword spotting systems to handle Farsi.

- Develop KWS components: speech-to-text models, index, search, and decision functions.
- Evaluate standard methods for speech enhancement (e.g., spectral subtraction, histogram normalization, and stochastic matching) on the KWS task.
