

U.S. Department of Homeland Security  
Washington, D.C. 20528

Homeland  
Security

22 June 2011

MEMORANDUM FOR: Rafael Borrás  
Under Secretary for Management

FROM: (b) (6) (b) (6)  
Director, Operational Test and Evaluation

SUBJECT: Director of Operational Test & Evaluation Letter of  
Assessment for the Transportation Security Administration  
(TSA) L3 Communications ProVision 100 Advanced  
Imaging Technology (AIT) System with Automatic Target  
Recognition (ATR) Follow-on Operational Test and  
Evaluation (FOT&E)

1. In accordance with Department of Homeland Security Acquisition Directive 102-01, dated 20 January 2010, and DHS Acquisition Directive 026-06, dated 22 May 2009, the DHS Director, Operational Test and Evaluation (DOT&E) submits this Letter of Assessment (LOA) to inform an upcoming Acquisition Decision Event (ADE) 3 program review for procurement of the Automatic Target Recognition (ATR) block upgrade and modification of L3 Provision 100 Advanced Imaging Technology (AIT) systems nationwide.

2. The DOT&E concludes the L3 Communications ProVision 100 AIT System with ATR to be effective and suitable as tested based on the system meeting all Key Performance Parameters (KPPs). (b) (5)

[REDACTED]

3. As with any new technology, as understanding of the technology matures, Test & Evaluation (T&E) strategies and efforts should likewise mature. (b) (5)

[REDACTED]

**WARNING:** This record contains Sensitive Security Information that is controlled under 49 CFR parts 15 and 1520. No part of this record may be disclosed to persons without a "need to know", as defined in 49 CFR parts 15 and 1520, except with the written permission of the Administrator of the Transportation Security Administration or the Secretary of Transportation. Unauthorized release may result in civil penalty or other action. For U.S. Government agencies, public disclosure is governed by 5 U.S.C. 552 and 49 CFR parts 15 and 1520

(b) (5)

4. The DOT&E also wishes to commend the TSA and TSL T&E community in developing and implementing the ATR T&E strategy in light of evolving system requirements and current understanding of the underlying technology. In addition, DOT&E must note and commend the considerable efforts and level of cooperation and collaboration observed amongst the various TSA elements, including the T&E, program management, and user communities, with respect to the ATR initiative. Their efforts clearly demonstrated the considerable agility of, and expertise contained within the TSA to translate ATR functionality into a viable operational capability that is expected to result in considerable positive impact on the traveling public. The DOT&E appreciates the insightful comments received from the TSA to the initial draft of the DOT&E AIT ATR Letter of Assessment.

CC:

Domenico Cipicchio  
TSA Deputy Assistant Administrator for Acquisition

## Introduction

This Letter of Assessment (LOA) conveys the Department of Homeland Security Director of Operational Test and Evaluation (DOT&E)'s independent assessment of testing and evaluation conducted through the Transportation Security Administration (TSA)'s Office of Security Technology (OST) and other sources, on the Passenger Screening Program (PSP) AIT project with ATR capability. The TSA currently employs AIT systems from two different vendors to assist with primary screening of passengers at aviation checkpoint locations, to deter conveyance of prohibited items into the sterile area. Although based on different technologies, currently deployed AIT systems provide a fundamentally similar capability, actively interrogating passengers which results in imagery information that are then parsed by Transportation Security Officers (TSOs) for anomalies. Any anomalies noted are verbally conveyed from the Image Operator (IO – located in an isolated area from the checkpoint to address privacy concerns) to a TSO at the checkpoint for resolution. While the actual screening of the passenger is essentially the same, the ATR capability enhancement automates processing of sensor information, displaying areas where anomalies are noted on an "avatar," or generic representation of the passenger undergoing screening at the checkpoint, which are resolved in accordance with modified standard operating procedures. This LOA is intended to inform an upcoming Acquisition Review Board (ARB) - program review for procurement of the ATR block upgrade and modification of L3 Provision 100 AIT systems nationwide.

The LOA focuses on data and findings as described in the approved TSA System Evaluation Report (SER) dated 6 May 2011 for the FOT&E, which was conducted at:

- Hartsfield-Jackson Atlanta International Airport (ATL), Atlanta, GA.
- Ronald Reagan National Airport (DCA), Arlington, VA, and
- McCarran International Airport (LAS), Las Vegas, Nevada

in the February-March 2011 timeframe. Three previously fielded L3 ProVision 100 systems were modified to include the ATR capability to assist with primary screening of passengers as systems of record under realistic demand profiles. Other currently operating AIT systems within each common checkpoint environment were not modified, to provide a credible comparative baseline for evaluation purposes. The LOA also includes findings and conclusions provided by complementary technical testing and evaluation efforts, primarily those conducted by the DHS Transportation Security Laboratory (TSL) as conveyed in the final Lab Qualification Test report dated 9 May 2011, as well as system detection performance data provided by the TSL in various classified briefings and reports, and observations gleaned by DOT&E during test bed site visits.

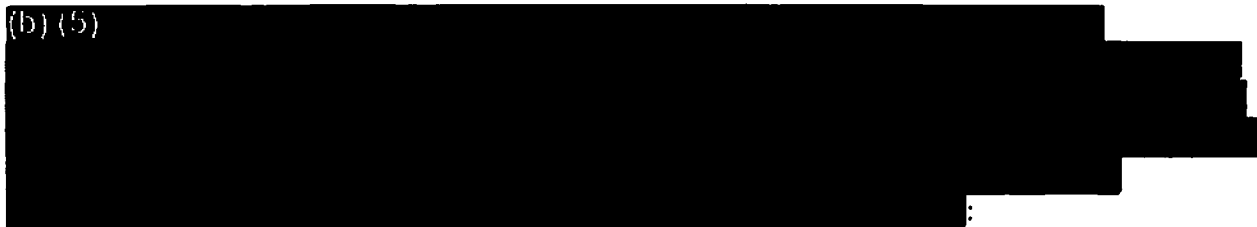

## Background and System Description

AIT (formerly Whole Body Imager, or WBI) systems have been employed by the TSA as a component of various "pilot" projects involving both primary and secondary screening of passengers in aviation checkpoint environments. Vice Walk-through Metal Detectors (WTMDs), which are fundamentally limited to detection of metallic items, AIT systems have the potential to assist TSOs with non-invasive primary screening of passengers for potential anomalies (b)(3), 49 USC 114(r). However (b) (3)

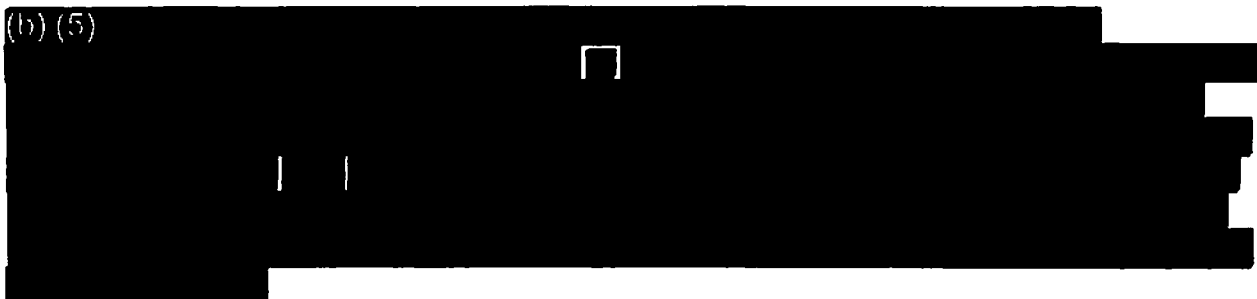

**WARNING:** This record contains Sensitive Security Information that is controlled under 49 CFR parts 15 and 1520. No part of this record may be disclosed to persons without a "need to know", as defined in 49 CFR parts 15 and 1520, except with the written permission of the Administrator of the Transportation Security Administration or the Secretary of Transportation. Unauthorized release may result in civil penalty or other action. For U.S. Government agencies, public disclosure is governed by 5 U.S.C. 552 and 49 CFR parts 15 and 1520

(b) (5)

(b) (5)

The L3 Communications ProVision 100 with ATR capability is intended to provide an automated passenger screening assist tool based on active millimeter wave technology, and is currently being considered for implementation on previously procured AIT units deployed for primary passenger screening as well as for future procurements. Passengers enter the system and are instructed to assume a common "ballerina" pose, at which time the scanner unit is activated via the operating console. If the scan is successful, any anomalies detected by the system are superimposed on an avatar image located on the operator panel (see Figure 1). Based on this information, the TSO either clears the passenger for Level 1 screening, or implements resolution procedures in accordance with standard operating procedures. Figure 2 below provides a nominal depiction of the L3 ProVision 100 system with ATR enabled (b)(3), 49 USC 114(r)

Figure 1. Operator Control Panel.

### **DOT&E Assessment of Test and Evaluation Adequacy**

In general, the Operational Test Agent conducted FOT&E as described in the approved Test and Evaluation Master Plan (TEMP) and Operational Test Plan (OTP). The scope of the evaluation effort focused on the contributions of the AIT ATR system in supporting the TSA's passenger screening mission. (b) (5)

**WARNING:** This record contains Sensitive Security Information that is controlled under 49 CFR parts 15 and 1520. No part of this record may be disclosed to persons without a "need to know", as defined in 49 CFR parts 15 and 1520, except with the written permission of the Administrator of the Transportation Security Administration or the Secretary of Transportation. Unauthorized release may result in civil penalty or other action. For U.S. Government agencies, public disclosure is governed by 5 U.S.C. 552 and 49 CFR parts 15 and 1520.

(b) (5)

The field portion of the FOT&E was conducted at three separate airport checkpoint locations, with typically-trained, representative TSOs operating the modified AIT units for passenger screening in accordance with the approved standard operating procedures and general concept of operations, as follows:

- Passengers were screened via the AIT as presented during typical checkpoint operations, with TSOs serving as divestment "coaches," to remind passengers to fully divest articles per the SOP.
- Passengers entering the AIT were instructed by the Screening Operator (or SO, which is to be the same sex as the passenger) to assume the proper scanning position. Once the passenger is positioned, the SO initiates the scan.
- The Screening Operator reviews the information provided by the AIT with ATR enabled. If the system indicates a clear, the passenger continues through the aviation checkpoint screening process. If the system indicates that anomalies are present (as displayed on the control console and avatar), these are resolved in accordance with the current Screening Checkpoint SOP.

(b) (5)

While utilization profiles, passenger base, interactions with TSOs, etc., can vary considerably between airports (and even within an airport, at different checkpoint locations), there is a reasonable expectation that FOT&E findings can be generally extrapolated as to expected AIT performance for screening passengers for domestic travel nationwide.

### Summary of Key Findings

The LOA focuses on data and findings as described in the approved TSA System Evaluation Report (SER) dated 6 May 2011 for the FOT&E. The LOA also includes findings and conclusions provided by complementary technical testing and evaluation efforts, primarily those conducted by the DHS Transportation Security Laboratory (TSI) as conveyed in the final Lab Qualification Test report dated 9 May 2011, as well as system detection performance data

provided by the TSI, in various classified briefings and reports, and observations gleaned by DOT&E during test bed site visits.

Based on test results, all Key Performance Parameters (KPPs - Table 1 below) as defined in the approved ORD were satisfied based on Qualification Test results, as well as results obtained through the FOT&E at ATL, DCA, and LAS under the noted test conditions.

**Table 1. Key Performance Parameters\***
